Review of: "Economics Research in the Twenty-First Century — 25 Years of Scientific Breakthroughs"

Juliana Teixeira¹

1. Serviço Social / Políticas Públicas, Universidade Federal do Maranhão, Brazil

The article "Economics Research in the Twenty-First Century — 25 Years of Scientific Breakthroughs" presents a comprehensive and substantive review of the main theoretical and practical trends that have shaped the field of contemporary economic research. The methodological instrumentation and handling of the literature are particularly interesting, given the certain academic disregard for the technical aspects of an investigation intended to scientifically support the dissemination of knowledge in various forms (article, review, monographs, etc.).

Despite numerous topics and a certain difficulty in reading the acronyms of the keywords, the rigorous systematization of recent economic studies, as well as the author's brief analytical contributions, are pertinent to the scientific understanding and explanation of emerging themes—such as technological advancement and climate change—and the traditional pillars of economic science.

These elements significantly enrich the academic debate within the field of Economics, especially for future economists in their early years of education.

Just a note regarding the beginning of the 21st century, conventionally marked as starting in 2001 (this convention is widely recognized in academic and scientific contexts, including the **ISO 8601** standard, which regulates the representation of dates).
