The authors have performed a valuable retrospective cross-sectional study. Please answer the following questions:

1- The main result is acceptable. However, the authors state that patients who were taking dyslipidaemia medication had significantly lower levels of HbA1c than those who were not taking it. How do they describe this? Dyslipidaemia medication lowers HbA1c, or the doctors have prescribed these drugs to patients with better care, disease control, and follow-up?

2- Please investigate and describe the etiology for the found correlations in this study in the discussion section.
