# Proximal myopathy with extrapyramidal signs

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Proximal myopathy with extrapyramidal signs. ORPHA:401768*

Proximal myopathy with extrapyramidal signs is a rare, hereditary non-dystrophic myopathy characterized by proximal muscle weakness, delayed motor development, learning difficulties, and progressive extrapyramidal motor signs including chorea, dystonia and tremor. Variable additional features have been reported - ataxia, microcephaly, ophthalmoplegia, ptosis, and optic atrophy.
