Potential competing interests: No potential competing interests to declare.

The paper presents some implications of Bell inequality, especially by taking the 'mind' of the observer into account. The perspective is nice as an add-on. I would like to see if this perspective has a resource-theoretic importance. The author motivates by mentioning that the interpretation of Bell inequality should be accessible to statisticians, I wonder whether the existing interpretation based on conditional probability over hidden variables does not serve this purpose.
