Potential competing interests: No potential competing interests to declare.

The authors sought to investigate the radiological outcomes in patients underwent lateral lumbar interbody fusion to manage adjacent level disease after spinal fusion surgeries.

Although the topic is very interesting and valuable of further investigation, I'd like to give some advice:

- Data about previous surgery should be stated
- Data about LLIF surgery as well are missing
- Some cases with x-rays are needed in an original paper like this one
- Data about preoperative and postoperative PROMS are missing, as well as preoperative and postoperative x-rays data
- The research methodology could be improved and stated in detail
- Discussion could be deepened more

Said so, the article is well written and I enjoyed reading it. Thank you
