Potential competing interests: No potential competing interests to declare.

This mini review underscores the urgency of addressing foodborne RNA viruses through a multi-faceted approach, encompassing comprehensive preventive strategies, surveillance, and strict adherence to food safety guidelines. By understanding the prevalence, transmission routes, and risk factors associated with these viruses, the global community can work towards minimizing the impact of foodborne illnesses and safeguarding public health.

I suggest citing updated articles having preventive strategies like vaccine development or FDA-approved drug development to overcome all the shortcomings and gaps and to focus our research target. To enhance focus on preventive strategies against foodborne RNA viruses, integrating these advancements can refine our understanding and efforts effectively.
