

Review of: "Mobile Phone Recycling and Stockpiling Behaviour in the UAE: A Gender and Age Study"

Nattapon Pansakun

Potential competing interests: No potential competing interests to declare.

In my view,

Here are a few suggestions that I gathered from a brief reading. I trust that these suggestions will be beneficial for you.

1. Requires improvement in grammar, sentence structure, clarity, coherence, and academic style.
2. The study's title lacks adequate specification of the primary outcomes. It should concisely convey the research's central focus and objectives, facilitating a clear understanding of its purpose and direction.
3. The study's results were deficient in presenting vital statistics, including correlation and level of significance.
4. It is not clear why the researchers focused only on age and gender factors when there may be many other factors that influence mobile phone recycling and stockpiling behaviour.
5. The study requires a more comprehensive literature review.
6. The sample obtained through nonprobability sampling may not be representative of the entire population, leading to potential sampling bias.
7. An unequal range of age categories in a study can introduce potential biases and limit the accuracy of the findings, researchers should provide a well-justified rationale for their chosen method of age stratification. This justification should be based on either previous research or theoretical reasoning?
8. It's important to adhere to the STROBE statement guidelines.
