and avoid redundancy to maintain reader engagement and clarity. While the results highlight significant associations between various socio-economic and demographic factors with anaemia prevalence in under-five children, the interpretation of these findings could be more nuanced. It would be beneficial to delve deeper into the implications of these associations and discuss the potential mechanisms underli

analysis of the results. While the manuscript briefly touches upon intervention efforts targeting rural areas and mothers with lower education levels and wealth to reduce anaemia incidence, a more detailed discussion on the policy implications of the findings would strengthen the practical relevance of the study. The conclusion summarizes the key findings of the study effectively. However, it would
