Potential competing interests: No potential competing interests to declare.

Overall, the paper seems to provide valuable insights into biliary complications post-liver transplantation in a Tunisian context, which could contribute to the broader global understanding of these challenges in liver transplantation.

Few comments:

Abstract: Consider adding information about ethical considerations, such as patient consent and data confidentiality.

Conclusion: Consider adding suggestions for how these findings could influence clinical practice or future research directions.

Discussion: Risk factors identified in the study are well-discussed. It would be beneficial to discuss any discrepancies or similarities with other studies in more depth. Consider discussing limitations in more detail, including how they might affect the interpretation of the results and generalizability.

Results: Tables or figures could enhance the presentation of the results, making them more accessible to readers.

Methods: Consider adding information about ethical considerations, such as patient consent and data confidentiality.
