An archive of manuscripts, usually a version of a published (or publishable) research report as submitted for publication or as accepted for publication. These archives are generally screened to ensure that the material is appropriate and include searchable metadata. There are a variety of types of repositories:

- Institutional Repository – a database for the storing and dissemination of the publications, theses, teaching material, data sets etc of a university or research institution
- Subject Repository – a database of self-archived manuscripts of publications from a particular scientific field, for instance high energy physics, biomedicine or economics.
