Dear Authors,

The manuscript, though improved, remains perplexing. Key areas necessitate revision:

The Abstract needs refinement to align with the research focus. Clarify the relevance of the phrase regarding fans in military fortifications in Iraq to the research aims.

The Introduction lacks clarity in background, research gap identification, and objectives. The inconsistent use of CGCC is confusing.

The stated objectives in the Introduction diverge from those throughout the manuscript, requiring coherence.

Figure 1 requires more detail, including dimensions, equipment orientation, and technical specifications.

Figure 4 is challenging to interpret and needs improvement to better explain how thermal comfort temperature is calculated. Additionally, a more detailed explanation of thermal comfort variables and their estimation methods would enhance understanding.

The Conclusions do not directly address the objectives outlined in the Introduction. Refocusing them to align with the initial research aims is essential.

Overall, addressing these aspects will significantly enhance the manuscript's clarity
