The paper published three case reports with postulation that PAMP-immunotherapy help to decrease the chronic fatigue symptom. It was an observation reporting of phenomenon with apparent effective and without objective outcome measures. The objectivity, repeatability and underline explanation are of major concerns of the study. Using side-effect of drug to induce fever is innovative. However, the recommendation of using ordinary vaccine as substitutes, which did not test should be of caution. I think the observation is preliminary and require more case studies and comparison group as control to eliminate the bias due to chances. Inclusion of biophysical measurement may help to improve the objectivity.
