**Potential competing interests:** No potential competing interests to declare.

The authors have chosen one of the most important aspects of the health issue to detect early diagnosis and can aim for preventive measures, which is absolutely essential!

The manuscript has been written nicely; however, there's still room for improvement.

Firstly, the language can be improved further.

Secondly, in T2DM risk assessment, family history of DM is one of the greatest risks, which is not included in this study (to be considered for future research).

Last but not least, the sample size is too small to predict the risk...the larger the sample size, the stronger the probability of prediction (for future study).

In my suggestion, it is a good paper to be published; however, some corrections need to be done.
