

Review of: "Gumbel's Extreme Value Distribution for Flood Frequency Analyses of Timis River"

Teresa Reyna

Potential competing interests: No potential competing interests to declare.

The article needs important adjustments. The introduction does not answer why extreme events should be evaluated in the Timis River hydrographic basin.

In the methodology, it is not clear whether one point or several points in the basin were considered for this study.

There is no conclusion or final considerations.

The reference bibliographic needs to be improved.
