# Selective Estrogen Receptor Degradar SRN-927

National Cancer Institute

## Source

National Cancer Institute. *Selective Estrogen Receptor Degradar SRN-927*. NCI Thesaurus. Code C120037.

An orally available, nonsteroidal selective estrogen receptor degrader (SERD), with potential antineoplastic activity. Upon oral administration, SERD SRN-927 specifically binds to the estrogen receptor (ER) and induces a conformational change that results in the degradation of the receptor. This prevents ER-mediated signaling and inhibits the growth and survival of ER-expressing cancer cells.
