Potential competing interests: No potential competing interests to declare.

I suggestion the rejection of the article titled as the manuscript " Determining kinetics parameters of bovine serum albumin protected gold nanozymes toward different substrates " Comments on the Manuscript are below:

1. You can find many studies on Bovine Serum Albumin Bioconjugated Gold Nanoparticles in the literature. In other words, no innovation has been added to the literature.
2. The introduction part is too short, it should be developed more...
3. Experimental parameters and characterization studies are very inadequate.
4. Manuscript writing is very sloppy.
5. In enzyme studies, parameters such as optimum pH and temperature, thermostability and storage stability, substrate concentration and reusability should be studied besides in the kinetic parameters.
