Potential competing interests: No potential competing interests to declare.

The manuscript aims to discuss new technologies and treatment techniques in the field of radiation therapy. Each section describes one of the advanced treatment techniques, including IMRT, SBRT, SRS, brachytherapy, and imaging techniques, including Computed Tomography (CT scan). Unfortunately, the manuscript isn't written in good English, and there is a lack of consistency in the text. The techniques are discussed briefly, and the important physics parameters are not mentioned in the text. A comparison between the advanced techniques is not presented, and their advantages and disadvantages are not investigated. I refer you to the revision file in which I mentioned some

In my opinion, the article needs major revision.
