Potential competing interests: The author(s) declared that no potential competing interests exist.

This is a study to understand the determinants to be considered for reducing the social inequalities among pediatric population.

Conducted on a small sample of 102 parents, clarity is missing on the sampling procedure.

Though the appropriate statistical tests are mentioned under statistical analysis, in the whole article I could not appreciate its significant use.

Hence the generalizability of the results are questionable.

Due to multiple variables considered the table is lengthy. Could be concised for more clarity.
