

# Review of: "Misdiagnosis of Dengue Fever as Malaria and Typhoid Fever and Their Co-infection in Rural Areas of Southwest Nigeria"

Oumaima Djarma<sup>1</sup>

<sup>1</sup> University of N'Djamena

**Potential competing interests:** No potential competing interests to declare.

**Title:** The title is relevant and attractive. The coinfection with dengue, malaria, and typhoid fever really poses a problem of differential diagnosis in resource-limited countries. However, the study period and year are missing.

**Introduction:** The introduction is coherent, and the problem is clearly stated.

**Methodology:** The author refers to representative sampling—on what basis? What type of sampling is used for this study, and how is the sample size calculated?

**Results:** Figures 3, 4, and 5 are not very comprehensible. What does the concentration range represent?

**Discussion:** The discussion is not very rich. Regarding the co-infection of malaria and dengue fever, there are several studies carried out in Africa which you could use to flesh out the discussion.
