# Review of: "Exploring the Impact of Future Land Uses on Flood Risks and Ecosystem Services, With Limited Data: Coupling a Cellular Automata Markov (CAM) Model, With Hydraulic and Spatial Valuation Models"

Wayan Suparta

**Potential competing interests:** No potential competing interests to declare.

Based on the overview of the background and the results, below is my input to improve the manuscript.

1. Why just look at the coupling of a Cellular Automata Markov (CAM) Model with Hydraulic and Spatial Valuation Models? Why is another related model not explored or compared? The advantages of both models are not clear.

2. Where can we see the calculation of Accuracy, MAE, and RSME of both models, as well as Kappa (κ)? Which model has the highest accuracy?

3. Where is the legend of Figure 2?

4. The conclusion, in my opinion, is too long. You should conclude your work more simply so that the readers can easily convey your findings.
