This is an interesting article. However, your abstract give the (false) impression of maternal screening for CMV infection. Nevertheless, for the general obstetric population, no professional groups or government health agencies advise universal serological screening for CMV infection. Furthermore, in the Pathogenesis, it is written that "HCMV is a frequent cause of congenital CMV disease, and all of the above infection types can complicate pregnancy". Although this is true, it should be emphasized that for the general obstetric population, no professional groups or government health agencies advise universal serological screening for CMV infection.
