The paper "Generative Artificial Intelligence Using Machine Learning on Wireless Ad Hoc Networks" is a good manuscript that needs changes. The paper can be accepted with some minor changes as discussed below:

1. The author is advised to refine the problem statement to explicitly mention the current limitations in wireless ad hoc networks that the proposed method aims to overcome and to include a clear research question or hypothesis.
2. The author is advised to make short sentences that give proper meaning. At some places in the manuscript, the whole paragraph is a single sentence that does not express the proper meaning.
3. The author is advised to provide a comprehensive description of the experimental setup, including the datasets used, the environment, and the evaluation metrics.
4. In the Results and Discussion section, authors are advised to establish a clearer link between the results and research objectives and to compare the findings with the related studies mentioned earlier in the paper.
5. In the Reference section, all references are not cited in the same format. The author is advised to use the same format for references throughout the reference section.
