Review of: "Functional Information of a Driven Cellular Automaton"

Szymon Łukaszyk[1]

1. Independent researcher

Only the 2nd minor remark of my previous review was partially addressed in this version, where Figures 16-19 show the results of simulations in the absence of the PE cells (I suggested simulations with CE cells replacing PE cells, not with PE cells absent/removed).

I recommend a revision that takes into account at least the constancy of the average CS for all SL patterns that stands behind the observed correlation between CI and FI.

Grid size discrepancy in Fig. 2 (declared 30×30 vs. shown 31×31) is still present.
