Potential competing interests: No potential competing interests to declare.

The article is an important contribution to irrigated agriculture. The integration of different activities in agriculture can increase economic feasibility.

At the abstract, I consider inserting the objective of the project. This objective should be connected with the conclusion. In the key words, I recommend that you choose words that are not used in the title.

In Figure 2, consider translating the technical diagram into English.

In the statistical analysis, what are the tools that you used in Excel? Average test? Regression? Why did you not use another statistical software? (For example, R Project for Statistical Computing)

Improve the quality of Figures 3 and 4.

In the results, it's important to use statistical analysis considering the experimental design. Tables only show averages. If you would like to recommend an approach for sustainable irrigated agriculture, you need to consider different statistical analyses.

I recommend an extensive revision of the article.
