Potential competing interests: No potential competing interests to declare.

Although the idea is novel, it does not say how the data were processed afterward. It is also worth including other sources; you can explore Google Earth Engine to see which databases can be helpful.

It is necessary to include a table of the day and time of the images used.

Also indicate the type of tides for those who do not know the area and how this has historically affected the study area.

The species section needs an indication of their relevance in the area.

It is advisable to broaden the discussion's depth, focus on what the article is proposing, and do an extended bibliographic review.

It is necessary to improve the wording, including the tables and figures in the text and the information shown in them.

It is worthwhile to review what types of nutrients, as compounds or substrates, reach this watershed and their relationship to dredging, for a better understanding of the possible environmental impacts.

It is necessary to rethink the article. At no time is the impact of dredging analyzed with the data they show. If they want to do that, it would be worthwhile to carry out sediment and biological sampling in the area. If you want to see the erosion of the coast, I through satellite images. I suggest you include other sources besides Google Earth PRO.
