Thank you for sharing your article. I do not think the article addressed vaccine hesitancy in the time of COVID-19. Instead, it reflected COVID-19 vaccine hesitancy in its own. The claim that COVID-19 vaccine was not well studied and not under continuous surveillance is not supported by evidence. What allowed faster discovery of the vaccine is global collaborations and ability to understand the virus genom and spike protein. At the end, the article was not representable of its title and was not successful in addressing vaccine hesitancy in the era of COVID-19 pandemic and the following period. I think more drastic changes need to be made and more details to be included like impact of COVID-19 on routine childhood vaccine hesitancy Vs seasonal vaccine hesitancy, the role of disinformation Vs misinformation and impacted populaiton (hesitancy among healthcare providers Vs general public).
