REVIEW

to the article by Moshe Segal "Energy Might Be the Only Unique, Distinct and Independent Entity in Nature"

The author of the article claims that mass, electric charges, as well as space-time are forms of manifestation of energy. There is no strong evidence in favor of such "philosophical" statements in the article. At the same time, without using any mathematical transformations, he immodestly declares that his theory is a generalization of Einstein's general theory of relativity, therefore he verbally includes electric charges in it. The statement regarding electromagnetic and gravitational waves is surprising. The author categorically states that these waves have nothing to do with matter, because they can exist and move independently of matter. The question then arises: what then is matter?

Despite all these comments, I wish the author to continue to be interested in all the secrets of Nature.
