Potential competing interests: No potential competing interests to declare.

An important topic. Today making students industry ready is becoming very crucial. Industry Institute interface to develop curriculum, programmes is essential. This paper studying the Industry Institute cooperation is timely. A few suggestions are provided to help the stakeholders develop a win-win bonding.

The Objective of the paper is not clearly defined. What is the purpose of the study, is it to highlight the weaknesses of the existing institutes and their curriculum or how the institutes should bid for international projects or how consultancy projects should be conducted. Or the need for faculty development.

Introduction mainly focuses on concept of NITTTR. It should focus on the need for Industry Institute interface, the current status and highlight the problem.

Literature review should focus on the importance of industry institute interface and the current status to identify the gap. The gap should help build the objectives.

The current objectives do not reflect the purpose of the study.

The SWOT should be mapped with the literature to show the advantage of NITTTR to win the bids over other Engineering institutes.

The case studies should help understand the objectives. How institutes can bid for projects, how they help the different stakeholders; industry, institute, students, curriculum development and training the teachers.

The discussion should flow from the research (linked to the research purpose).

The conclusion section could draw implications for the institutes, industry, faculty and students. The section could also identify policy implications.
