Review of: "How many papers are published each week reporting on trials of interventions involving behavioural aspects of health?"

I am not sure what why this paper was written. A great deal of papers are published on behavioural interventions each week. Why is this important? Obviously, when the literature is vast, it is a challenge to review. What is the purpose of a review? Usually it is on a very narrow topic framed using PICO(T). This does narrow the situation quite a bit. But I do agree, too much information. Also the quality of the papers is likely poor as well. So it seems to me the paper is an ad for some AI tools of which 2 are presented. One of the authors is a developer of the Behavioral Change Project. Would it not be more informative to compare and contrast the AI method with the hand method on a topic of narrow focus so we can see the strengths of the AI method. As this paper stands, I see it as an introduction to a paper on the new AI methods and not a stand alone paper.
