Generally this is a novel study. The use of data science approach with multi-factor which is more realistic as compared to other modeling approaches. However there some minor issues that need to be cleared out.

1. A good statistical approach. However the method used are not clearly shown.
2. The literature look shallow and re-organize the paper, to have a flow.
3. How did you test the accuracy of the data used from March 2020 - June 2023?
4. This looks like a report of 58 counties, may be make it more scientific research.
5. Improve on the abstract and the references sections.
