# Thin ribs-tubular bones-dysmorphism syndrome

INSERM

## Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Thin ribs-tubular bones-dysmorphism syndrome. ORPHA:1506*

Thin ribs-tubular bones-dysmorphism syndrome is an extremely rare, lethal, primary bone dysplasia characterized by thin ribs, thin long bones, high-arched palate and facial features of frontal bossing and low-set, posteriorly rotated ears. Bilateral cryptorchidism may be also observed. There have been no further descriptions in the literature since 1990.
