Potential competing interests: No potential competing interests to declare.

This manuscript presents an interesting App for the recognition of flags, identifying them with the corresponding country. It is based on a well widespread Machine Leaning algorithm. In the literature review part, the author needs to clearly put forward the shortcomings of the existing algorithms in the national flag recognition, and put forward the innovation points and advantages of the proposed method. In my opinion, the concluding section should be extended. The references should be as per the guidelines of the Journal.
