Potential competing interests: No potential competing interests to declare.

The authors carried out an epidemiological study on Staphylococcus aureus mastitis in the Hawassa Town province of Ethiopia. The rationale for the work and the methods used are adequate. The results are discussed fully and compared with many other bibliographic data regarding similar studies carried out over a long period of time in Ethiopia. The text is linear, so I am not able to fully evaluate the correctness of the English language.

The article may be published after possible revision of the English language if deemed necessary.
