

# Review of: "Ecological diversity, structure and exploitation of rattan stands according to a disturbance gradient around the Nkoltang forest, Estuary province of Gabon"

Yong Zeng

Potential competing interests: No potential competing interests to declare.

1. EAA and NTFP should be explained when they first appear.
2. When citing literature, you can cite some new literature in recent years.
3. The preface can say less about the content of the rattan area and more about the ecological diversity.
4. The chart is not standard. French should not appear in the chart of the article.
5. The scientific problem to be solved is unclear and should be addressed at the forefront of the article and in the discussion of the results obtained.
