# Benign Fibrous Histiocytoma of Bone

National Cancer Institute

## Source

National Cancer Institute. *Benign Fibrous Histiocytoma of Bone*. NCI Thesaurus. Code C53963.

A rare, benign neoplasm, usually arising from the non-metaphyseal regions of long bones or pelvis. It is characterized by the presence of fibroblastic spindle cells arranged in a whorled storiform pattern, osteoclast-like giant cells, foam cells, inflammatory cells, hemosiderin deposition and stromal hemorrhage.
