This paper provided a scheme for symmetric key generation based on Pythagorean and Reciprocal Pythagorean triple. The scheme uses a Key Distribution Centre (KDC) for user authentication and the secure exchange of secret information to generate keys. So the authors issued a novel mechanism to determine Pythagorean and Reciprocal Pythagorean triples to generate keys in the paper.

I think their method is interesting and novel. It may be applied in practice and gain some advantages over the previous methods.

So I would suggest that the paper be accepted.
