

Review of: "Effective Communication in Virtual Project Teams at Children Mission Africa: A Short Communication"

Animesh Agrawal¹

¹ National Institute of Technology Raipur

Potential competing interests: No potential competing interests to declare.

1. The paragraph starts by asserting the prevalence of virtual project teams in today's digital era without providing any empirical evidence to support this claim. While it's true that virtual teams are increasingly common, the extent of their prevalence is not clearly substantiated.
2. The case study focuses solely on Children Mission Africa (CMA), which may not be representative of all virtual project teams. Drawing broad conclusions about effective communication strategies based on a single case study might lead to oversimplification and overlook the diversity of challenges and solutions across different contexts.
3. The references cited in the paragraph predominantly support the notion of research gaps in understanding communication challenges and strategies in virtual teams. However, there might be studies contradicting these claims or offering different perspectives that are not mentioned, raising questions about the impartiality of the argument presented.
 - a. Knowledge management & It's origin, success factors, planning, tools, applications, barriers and enablers: A review.

Authors can review the following literature to improve the quality of the article:

- a. Employee productivity and service quality enhancement using ERP with knowledge management: a study in a power distribution company in the global context.
1. The paragraph assumes that strategies and challenges identified in the context of CMA's virtual project team can be universally applicable to all virtual teams. However, communication dynamics can vary significantly depending on factors such as team size, industry, cultural composition, and project scope, which might not be adequately addressed by focusing solely on one case study.
2. While the paragraph highlights research gaps, it overlooks existing literature on effective communication in virtual teams. Numerous studies have already examined various aspects of virtual team communication, including challenges, strategies, and cultural influences. Ignoring this body of research risks redundancy and may undermine the credibility of the study's contribution.

Overall, while the paragraph articulates the importance of addressing research gaps in understanding communication dynamics in virtual project teams, it could benefit from a more nuanced and critical analysis of existing literature, a broader scope of case studies, and a transparent discussion of methodology to strengthen its argument and scholarly contribution.
