Potential competing interests: No potential competing interests to declare.

Strengths:

Comprehensive overview: The article offers a comprehensive overview of the challenges faced by the aging population and care facilities during the COVID-19 pandemic. It covers various aspects such as vulnerability, infection prevention, quarantine measures, practical recommendations, and the challenges of the pandemic.

Focus on nursing role: The article emphasizes the important role of nurses in caring for older adults during the pandemic. It highlights the need for specialized nursing staff, interdisciplinary collaboration, and access to necessary aids for residents with COVID-19 symptoms.

Addressing specific needs: The article recognizes the specific needs of older adults with dementia and highlights the negative consequences of social isolation on their well-being. It emphasizes the importance of social and emotional approaches for communication and quality of life.

Practical recommendations: The article provides practical recommendations for institutions and healthcare professionals to minimize infection risks while maintaining the well-being and self-determination of residents. It suggests early contact with health authorities, individualized solutions, open communication with families and staff, and consideration of psychosocial needs.

Alignment with existing research: The article's findings align with existing research on the impact of COVID-19 on nursing homes and long-term care facilities. This alignment enhances the credibility of the article and supports its conclusions.

Weaknesses:

Limited empirical evidence: The article does not provide extensive empirical evidence to support its claims and recommendations. While it references existing research, more empirical data and studies could strengthen the arguments and provide a more robust basis for the recommendations.

Lack of discussion on policy changes: The article briefly touches on the wider implications of the pandemic in the field of elderly care, but it does not delve into potential policy changes or recommendations for policymakers. Including a more in-depth discussion on policy implications would have added value to the article.

In conclusion, the article "Changes Caused by COVID-19 in the Aging Population and the Role of Nurses in Care"

effectively highlights the challenges faced by the aging population and care facilities during the pandemic. It emphasizes the important role of nurses and provides practical recommendations for mitigating risks and addressing the specific needs of older adults. While the article could benefit from more empirical evidence and a deeper discussion on policy changes, it contributes valuable insights to the understanding of COVID-19's impact on the aging population and nursing care.
