Review of: "Determining Affinity of Social Network using Graph Semirings"

Zongshui Wang

Potential competing interests: No potential competing interests to declare.

The topic is interesting, however, there are many shortcomings need to revised. 1) the introduction doesn't present the research gap clearly, especially the theritical value. 2)Graph Semirings is the core method to determine affinity of social network, so it needs a section to explain this method, and provide much more details and theritical foundations. 3)I don't think the number of vertices in the Fig.1 can sufficient support the research, the authors need collect more data and construct a big social network. 4)it need compare with other algorithms to prove the effectiveness.
