The article is extremely relevant, highlighting the training needs of faculty members to upscale themselves as part of a continuous learning process and further enable them to successfully bid for international research project proposals. The study has an interesting flow which initiates from providing detailed statistics pertaining to need analysis and then derives at the statement of the problem. The fifth section particularly stands as a unique contribution of the paper, wherein the state-of-the-art technology programs are elucidated. The paper is extremely well written, and I would recommend it for publication in a standard academic journal. However, a comparative analysis involving quantitative analysis would enhance the quality of the paper.
