Dear authors,

A good descriptive paper on the possible role of Chat GPT for the military applications, and of course these are 'according to ChatGPT' itself. There are some comments that might be of use to enhance these findings:

1. ChatGPT itself may add more values by critically describing how it can improve military applications it mentioned ie Robotics, Medicine, et. al. For example ChatGPT said it can contribute to medical diagnostic. By elaborating what kind of training it requires to perform this function would a good addition.
2. I notice that all its contributions were proposed on the basis it requires training, hence the sentence 'ChatGPT can be trained...' It should declare what training it needs to perform its intended role.
3. In the last para before Conclusion topic, the ethical concerns kind of 'rule out' (forgive me for the lack of word) these intended role and possible contribution. Perhaps its time for itself to be accounted for, or be programmed with a bit of responsibility, or even with some normal distributed accountability or ethics, so that it can be really use for military applications.
