Potential competing interests: No potential competing interests to declare.

This article seems to be a questionnaire based study performed in a specific region of India, where the traditional system of medicines are still being in use. Due to lacking in literacy rate, poor transportations, bad weather, hesitation to modern healthcare system peoples from villages are still relying on herbs (alternative medicine) procured from the mother nature from times immortal. It's also a fact that in India the midwives/dais are still providing their services to the tribal community or the backward villagers. Currently the researchers are showing interest to explore the herbs/plants with numerous pharmacological activities to avoid side effects which the synthetic drug molecules exhibit. Therefore, this questionnaire based study may help the traditional therapists/ researchers to explore the herb/plant's unexplored activities, just like, in the article the authors have mentioned two new plant's activity specially emphasizing on uterine prolapse (which was unexplored earlier), which could be a potential idea for developing novel therapeutic agent in near future. Lastly, I would like to share my feedback that it could be considered for publication.
