Potential competing interests: No potential competing interests to declare.

Based on a unique Algorithmic Thinking Theory (ATT), the manuscript unconventionally, theoretically, multifacetedly, and concisely explains why and how the market-government mix may intensify prosperity in an economy. This may have important policy implications for any state that plans to maximize prosperity for its inhabitants.

The short manuscript is an interesting piece of work, but in no way scientific; it is more of a light and brief popular science overview essay of thoughts rooted in research. It holds interesting views on the interplay between market and government, but it has no explicit and clear research question, no research is conducted, and it is not based on any explicit theory or analysis. However, it gives a fairly good introduction to an interesting theme.

I would reject this manuscript as it doesn't hold the standards it should in any field.
