Great job!! Very necessary type of work! I have some considerations. First of all, English is not my mother language, but this sentence sounds so strange: "*Giardia lamblia* infection results from ingesting environmental hard cysts through the anal-oral route, contaminated food, or wate." I mean, ingesting XX through the anal-oral route? I know you wanted to make a reference to the anal-oral route, but it sounded strange to me.

Another thing, the use of X-square only compares if there are differences between groups in relation to the outcome. I strongly recommend adding a column to the table and the calculation of an Odds Ratio. It would make your work even greater. Also, clarify what "random systematic selection" means - it can help if someone is in need of guidance on methodology when reading more papers !

Thank you.
