**Potential competing interests:** No potential competing interests to declare.

The article is very well structured, and the sample design is correct. However, I think it would be interesting to add data on the resistance of isolated *S. aureus*. Today, we are thinking a lot about health only, and it would be extremely important to know about the resistance of pathogens, since resistance to antimicrobials and its spread is a global problem and is closely linked to public health.

I think it should be accepted if there was this complementation.
