This current version of the document needs several improvements as already reported by the previous reviewers. I would like to point out the following major flaws:

1. A careful English review is required throughout the entire text.
2. It is difficult to see connections between the figures shown in the paper.
3. The paper is too short, lacking literature review, methodology, and the main conclusion.
4. Figure 1 is misleading since regions with less tree cover is considered as tree loss.
5. There is several publications and deforestation data from the Brazilian Amazon that could be used to enrich the paper. Some of them provide data at the municipality level.
6. Please, provide details about the "Reforesting_now" in the manuscript. I believe this is the title of some project. Provide a more detailed title of the article so that readers can have a better idea about the subject of the paper.
7. In the article, the authors should provide some citations about the success of the Augmented Reality technology in other regions.
