

Review of: "Quantum Theory of Soul"

Dragan Mlakić

Potential competing interests: No potential competing interests to declare.

Authors in the Conclusion have declared that a quantum model of the soul can give predictions about properties like spiritual abilities such as direct knowing, telepathy, clairvoyance, intuition, and psychokinesis. Those properties are not or not yet known to be correlated to the soul. The definition of soul can't be politically correct in any way. From religious to scientific, it encompasses more areas than it at first sight seems to. Soul, defined as "information carried by the quantum field," is applicable to any form of matter, no matter if it is breathing or not. Feelings are not the soul, and feelings have a different entropy level if Shannon's entropy theory is applied to the content of the presented manuscript. Consciousness, including the soul, is the core thesis of this manuscript. It is discussable in terms of philosophy, religion, theology, biology, chemistry, etc. Just this paper is not enough for the declaration of the soul, but it's a good starting point.
