

Review of: "Some Possibilities of Increasing the Completeness of Oil and Gas Recovery"

Maryam Khosravi

Potential competing interests: No potential competing interests to declare.

The manuscript by L.B. Berman aims to draw attention to the crucial role of natural phenomena within oil and gas pools in influencing the completeness of recovery. The manuscript spans 60 years of research by a diverse group of specialists, culminating in the identification of key natural phenomena and their impact on recovery.

Strengths: Thorough Investigation, Practical Proposals, Structured Presentation

Suggestions for Improvement: While the manuscript discusses various natural phenomena, the findings could be presented more explicitly. Clear connections between observed phenomena and their impact on recovery, supported by specific examples or case studies, would enhance the manuscript's clarity. The manuscript lacks a clear statement highlighting the novelty of the research. Clearly articulating the unique contributions and advancements made in understanding natural phenomena and proposing recovery strategies will strengthen the manuscript.
