I appreciate your effort on writing the article. I think the methodology section needs more clarification. The sampling frame should be clearly mentioned and should also include how many colleges were selected among total colleges. I would also advise to put the response rate as it is less likely to get 100% participation rate. Also, in figure 3 and 4, the total number of participants i.e. those affected (n) can be added so that it becomes more clear. It would have been interesting to know if the infection and re-infection occurred in vaccinated or unvaccinated ones.
