

Review of: "Acoustic Over-Exposure in the Institutional Land Use of Calabar Metropolitan Area, Cross River State, Nigeria"

Hassan Alhilli

Potential competing interests: No potential competing interests to declare.

This manuscript investigates the Acoustic Over-Exposure in the Institutional Land. Despite the importance of the research subject, some notes should be clarified:

1. The phrase should not be repeated (Every tertiary institution is meant to be a center of excellence in terms of academic activities as well as an enabling environment to achieve such. However, many of these academic settings have turned into activity hubs of varying natures of land uses, which daily generate high acoustic levels.) in the introduction and Abstract.
2. In Figure No. 2, what do Y Access and X Access represent? The explanation must be placed in the figure.
3. It is necessary to review the analysis of variance literature and establish the base variable and its dependent variable.
4. They are conducting statistical tests for normal distribution. On the other hand, the results reached must be written and statistically tested.
5. Recommendations must be given based on the results reached by the researcher.
6. "This leads to the conclusion that increased socio-economic and educational activities within the University of Calabar environment have led to increased noise level." This statement is a fact and not a conclusion
7. Modern references must be adopted as it has been noted that there are old references.
8. The article needs substantial modifications.
